National Semiconductor

## General Description

The DS8881 vacuum fluorescent display driver will drive 16-digit grids of a vacuum fluorescent display. The decode inputs select one of the sixteen outputs to be pulled high. The device contains an oscillator for supplying clock signals to the MOS circuit, the filament bias zener and $50 \mathrm{k} \Omega$ pulldown resistors for each grid. Outputs will source up to 7 mA . The DS8881 is designed for 9 V operation. If the enable input is pulled low, all outputs are disabled.

Note 1: "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. They are not meant to imply that the devices should be operated at these limits. The table of "Electrical Characteristics" provides conditions for actual device operation.
Note 2: Unless otherwise specified, $\mathrm{min} / \mathrm{max}$ limits apply across the $0^{\circ} \mathrm{C}$ to $+70^{\circ} \mathrm{C}$ range. All typicals are given for $\mathrm{T}_{\mathrm{A}}=25^{\circ} \mathrm{C}$.
Note 3: All currents into device pins shown as positive, out of device pins as negative, and all voltages referenced to ground unless otherwise noted. All values shown as max or min on absolute value basis.
Note 4: Approximately $50 \%$ of input current on pins $4,5,6,7$ is shunted to $V_{B B}$. If minimum $I_{B B}$ is desired, then $I_{\mathbb{N}}$ should be minimized by using resistors in series with the inputs.

## AC Test Circuit

LIFE SUPPORT POLICY
NATIONAL'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT OF NATIONAL SEMICONDUCTOR CORPORATION. As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and whose failure to perform, when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
2. A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.
