SEMICONDUCTOR

74F574 Octal D-Type Flip-Flop with 3-STATE Outputs

General Description

The 74F574 is a high-speed, low power octal flip-flop with a buffered common Clock (CP) and a buffered common Output Enable ($\overline{\text{OE}}$). The information presented to the D inputs is stored in the flip-flops on the LOW-to-HIGH Clock (CP) transition.

This device is functionally identical to the 74F374 except for the pinouts.

Features

Inputs and outputs on opposite sides of package allowing easy interface with microprocessors

April 1988

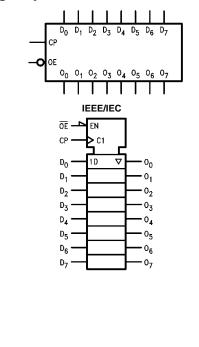

Revised October 2000

- Useful as input or output port for microprocessors
- Functionally identical to 74F374
- 3-STATE outputs for bus-oriented applications

Ordering Code:

| Order Number | Package Number | Package Description |

Functional Description

The 74F574 consists of eight edge-triggered flip-flops with individual D-type inputs and 3-STATE true outputs. The buffered clock and buffered Output Enable are common to all flip-flops. The eight flip-flops will store the state of their individual D inputs that meet the setup and hold times requirements on the LOW-to-HIGH Clock (CP) transition. With the Output Enable (\overline{OE}) LOW, the contents of the eight flip-flops are available at the outputs. When \overline{OE} is HIGH, the outputs go to the high impedance state. Operation of the $\overline{\text{OE}}$ input does not affect the state of the flipflops.

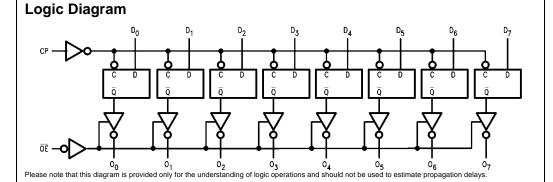

Function Table

| I | nputs | | Internal | Outputs | Function |
|----|-------|---|----------|---------|-------------------|
| OE | СР | D | Q | 0 | Function |

74F574

0°C to +70°C +4.5V to +5.5V

Note 1: Absolute maximum ratings are values beyond which the device may be damaged or have its useful life impaired. Functional operation under these conditions is not implied.

Note 2: Either voltage limit or current limit is sufficient to protect inputs.
